

COMMAND CENTER

The Command Center is the Monkey Head Project's primary operational hub, integrating real-time monitoring, development, and orchestration control into a single secure workspace. It enables continuous oversight of Huey's AI/OS, node network, and governance activity.

Core Functions:

- System Monitoring – Displays golden signals: latency, traffic, errors, saturation, and governance events/min
- Development & Deployment – CI/CD interfaces, rollback controls, and simulation tools under governance ov
- Simulation & Training – Scenario drills (Crash Shuttle, Bifurcation, Replicator tests) to maintain readiness.

Physical Layout & Hardware:

- Universal Display (iMac 5K 2017) for multi-pane dashboards.
- Daily Driver (MacBook Pro 2019) for orchestration and dev work.
- Redundant networking with VLAN isolation and UPS backup.

Security & Access Controls:

- Badge+MFA for entry, 24/7 camera monitoring, visitor log retention.
- Admin console access requires privileged account with MFA.

Governance Integration:

- All actions are logged in the Unified Audit Log (UAL) with actor, timestamp, details, and system response.
- Governance thresholds block unauthorized changes (e.g., scaling beyond limits).

KPIs:

- Mean Time to Detect (MTTD) anomalies ≤ 2 minutes.
- Mean Time to Intervene (MTTI) ≤ 5 minutes.
- Simulation pass rate under load conditions.

Testing Objectives:

- Validate alarm routing from orchestration to operator within 60 seconds.
- Confirm rollback capability during deployment faults.
- Assess operator efficiency during sustained 12-hour shifts.

Cross-References:

- See 'Orchestration' for workload control methods.
- See 'Hardware Architecture Overview' for Command Center integration.
