

SYSTEM OVERVIEW

The System Overview provides a high-level description of Huey's core architecture, governance model, and operational philosophy. It serves as a roadmap for understanding how the AI/OS integrates hardware, software, and governance into a unified framework.

Key Components:

- Huey AI/OS – The central intelligence and operating system responsible for coordination and execution of all functions within the Monkey Head Project.
- Hierarchy Models – Layered architecture (MacroOS, MicroOS, NanoOS) for strategic, operational, and real-time control.
- Node Types – Distinct roles for computational and functional nodes within Huey's ecosystem.

Governance Integration:

- Huey operates within a Federation governance model, ensuring all actions align with constitutional and ethical principles.
- Decision-making processes are distributed but unified through shared memory and audit logs.

Operational Philosophy:

- Modularity – Systems and subsystems are designed for easy replacement, upgrade, or expansion.
- Expandability – Architecture supports the seamless addition of new technologies and nodes.
- Resilience – Built-in redundancy and fault tolerance ensure continuous operation under stress.

The following pages break down each major element of the system in detail, starting with the Huey AI/OS and progressing through the hierarchy models and node structures.
