

NODE TYPES

Node Types within the Monkey Head Project define the distinct computational and functional roles that work together to achieve system objectives. Each node type is optimized for specific tasks and operates under governance protocols to maintain coordinated action.

Conductor Node:

- Central coordination point directing the activities of connected nodes.
- Interprets strategic directives and allocates workloads.

Symphony Nodes:

- Distributed units that carry out assigned tasks autonomously within parameters.
- Provide redundancy and fault tolerance across the network.

Specialized Nodes:

- Nodes with dedicated roles such as AI training, data analysis, or environmental sensing.
- Can be added or removed without disrupting overall system functionality.

Replicator Nodes:

- Capable of self-replication to address demand spikes or specialized requirements.
- Governed by safeguards to prevent uncontrolled proliferation.

Pebble Nodes:

- Temporary, task-specific instances activated for research, analysis, or voting in governance.
- Automatically deactivated upon completion of their assigned function.

Governance Context:

- Node activities and changes in status are recorded in the Unified Audit Log.
- Deployment or removal of nodes requires governance oversight.

Testing Objectives:

- Validate role performance under expected workloads.
- Measure resilience when nodes are taken offline or fail unexpectedly.
- Assess scalability when integrating additional nodes of various types.
