

COMMAND CENTER

The Command Center serves as the operational hub of the Monkey Head Project, merging research, development, and live system management into a unified environment. Located in a central workspace, it integrates hardware, software, and user interfaces for seamless control.

Core Functions:

- System Monitoring – Displays real-time performance metrics, AI activity, and governance updates.
- Development Environment – Hosts coding, testing, and deployment tools for Huey's modules.
- Scenario Simulation – Runs stress tests and training simulations in coordination with governance.

Primary Components:

- Universal Display (iMac 5K 2017) for high-resolution visualization of data and system status.
- Daily Driver (MacBook Pro 2019) for managing orchestration tools like Docker and Kubernetes.
- Networking infrastructure for low-latency communication with distributed nodes.

Operational Advantages:

- Centralized command improves response time during high-priority events.
- Integrated Z-Wave network and environmental sensors for smart workspace management.
- Ergonomic layout to support extended monitoring and development sessions.

Governance Integration:

- Decisions and operational changes made in the Command Center are logged in the Unified Audit Log.
- Governance panels can review live activity and approve or halt operations as needed.

Testing Objectives:

- Evaluate the Command Center's role in enhancing decision-making efficiency.
- Measure response times for scenario-based interventions.
- Validate integration between physical workspace and distributed AI infrastructure.
