

IMAC 5K 2017

The iMac 5K 2017 serves as the Universal Display in the Monkey Head Project, providing a high-resolution interface for monitoring, visualization, and system control.

Key Specifications:

- 27-inch Retina 5K display for detailed visual output.
- 48GB DDR4 RAM to handle multiple visualization and monitoring applications.
- 1TB Fusion Drive combining HDD capacity with SSD-like performance.

Primary Roles:

- Data Visualization – Displays real-time system metrics, AI activity, and simulation results.
- Control Interface – Serves as a hub for issuing commands and overseeing distributed nodes.
- Container and Cluster Management – Provides visual oversight for Docker and Kubernetes systems.

Operational Advantages:

- High-Resolution Display – Allows detailed analysis of large datasets and AI outputs.
- Enhanced Multitasking – Large screen real estate supports simultaneous monitoring of multiple systems.
- Stable Performance – Capable of running visualization tools without impacting other operations.

Governance Integration:

- Displays governance dashboards for real-time decision-making support.
- Logs interactions and issued commands into the Unified Audit Log.

Testing Objectives:

- Assess clarity and performance of data visualizations under varying workloads.
- Validate integration with orchestration tools for live monitoring.
- Measure operator efficiency improvements using the high-resolution interface.
