

PLANE & SUBMARINE LOGISTICS

Plane & Submarine Logistics provide a safety and redundancy framework inspired by aviation and submarine systems, focusing on reliability in extreme or failure-prone environments.

Core Principles:

- Redundant Systems – Multiple independent backups to prevent single points of failure.
- Fail-Safe Protocols – Automatic transition to safe states under fault conditions.
- Self-Sufficiency – Systems capable of prolonged operation without external support.

Implementation in Huey:

- Multi-path networking and redundant power supplies.
- Automatic load shifting when a node fails.
- Energy management protocols for sustained operation.

Governance Integration:

- Safety protocols are documented in the Unified Audit Log.
- Governance committees review changes to redundancy systems.

Testing Objectives:

- Simulate power or network failures to assess automatic recovery.
- Measure operational duration under limited resource conditions.
- Validate governance oversight in emergency decision-making.
