

THESIS

The Monkey Head Project is founded on the belief that with sufficient resources, time, and determination, a single individual can develop a robotic system embodying autonomy, modularity, and expandability.

By leveraging both existing and emerging technologies in combination with a systematic engineering approach, the Project aims to prove that advanced robotics and AI are within reach for dedicated technologists and enthusiasts—not just large institutions.

Core Principles:

- Autonomy – Capable of independent operation with minimal human intervention.
- Modularity – Both hardware and software are built in interchangeable components.
- Expandability – Designed for continuous evolution and integration with future advancements.

Combining practical engineering with long-term vision, the Project seeks to develop not only a robot, but a replicable platform for adaptation, learning, and future integration.
