

CRASH SHUTTLE SCENARIO

The Crash Shuttle Scenario simulates the discovery of an unknown vessel—potentially of alien origin—and outlines the protocols for its secure investigation and integration. It serves as a stress test for Huey's ability to manage high-risk, high-opportunity technology integration while adhering to ethical and operational standards.

1. Discovery & Site Security:

- Establish a secure perimeter with automated surveillance and controlled access.
- Assess immediate hazards such as radiation, unstable structures, or hostile elements.

2. Initial Assessment:

- Conduct a preliminary inspection to determine the vessel's structural integrity.
- Identify potential threats and determine containment or shielding requirements.

3. Command Base Establishment:

- Deploy a mobile command hub for data processing, coordination, and oversight.
- Ensure continuous communication between the crash site and main Huey systems.

4. Power Restoration & System Access:

- Reconnect essential systems using controlled power inputs to avoid overload.
- Access and catalog onboard systems for later study and integration potential.

5. Defensive Protocols:

- Activate physical and digital defenses against intrusion or tampering.
- Implement failsafes to isolate Huey from potential malicious software.

6. Ethical Integration:

- Assess compatibility and safety of any discovered technology before integration.
- Follow Federation ethical guidelines to ensure responsible adoption.

7. Continuous Monitoring:

- Track the performance and security of integrated components over time.
- Maintain a rollback capability for removing unsafe or unstable elements.
