

HARDWARE ARCHITECTURE

The Hardware Architecture section describes the physical components that form the backbone of the Monkey Head Project. Each system has been selected for its reliability, scalability, and ability to integrate with Huey's AI/OS and governance systems.

Key Systems:

- Dual Motherboards – High-performance paired boards for primary and auxiliary processing.
- Command Center – Centralized operational hub combining development and live management.
- MacBook Pro 2019 – Primary development machine for software and orchestration tasks.
- iMac 5K 2017 – High-resolution display and monitoring station.
- MacBook Pro 2012 – Legacy system interface for older hardware compatibility.
- Legacy Hardware Integration – Preserves support for historical computing platforms.

Design Philosophy:

- Modularity – Components can be swapped or upgraded with minimal disruption.
- Expandability – Supports the addition of new hardware for scaling processing power or storage capacity.
- Reliability – Uses proven, durable hardware to ensure operational continuity.

Governance Integration:

- Hardware deployments are recorded in the Unified Audit Log.
- Physical changes require authorization under Federation governance rules.

The following pages provide detailed breakdowns of each component, including specifications, roles, and integration into Huey's overall architecture.
